Highlights

- Support for small modular reactors (SMRs) in the United Kingdom is generally high, but support is lower in Scotland.
- Framing SMRs as reactors (as opposed to power stations) in a survey-based experiment decreases support only marginally.
- Framing SMRs as being in one's local area (as opposed to the UK) lowers support by only a small amount.
- The negative effect of a local area frame is larger in Scotland. Lower support in Scotland is concentrated among supporters of Scottish independence.
- Support for SMRs is also lower in those parts of the UK near existing nuclear site.
